The Æther-flow Interpretation of Relativity

Primitive-Reservoir Observer-Reduction
Femto-Section-Generating Substrate Atto-Section Dynamics
Next Benchmark Criterion

Abstract

The current active-primary theorem already removed the current femto-section package $\mathfrak{Z}^{\text{femtosec}}$ as a primitive stopping point by deriving it canonically from the deeper current atto-section package $\mathfrak{A}^{\text{attosec}}$. This renews the live frontier. Another same-output deeper-origin relay that merely preserves $\mathfrak{A}^{\text{attosec}}$ and therefore merely reproduces the same current femto-section package $\mathfrak{Z}^{\text{femtosec}}$, the same current pico-section package $\mathfrak{Y}^{\text{picosec}}$, the same current minimizer-section core $\mathfrak{Y}^{\text{pic,sec}}$, the same current nano-section package $\mathfrak{X}^{\text{nanosec}}$, and the same downstream micro-section and sub-section packages no longer counts as the honest default next benchmark-facing manuscript. Neither does a re-expansion back to the larger minimizer-image-core or full pico-section presentation, and neither does a quantum branch that does not do that same benchmark-facing work.

This note records the routing consequence of that theorem. The next honest benchmark-facing move must either derive or justify the current femto-section-generating substrate atto-section dynamics package $\mathfrak{A}^{\text{attosec}}$ from still more primitive substrate structure in a way that changes benchmark-facing status, or prove a genuinely smaller theorem-level collapse strictly inside $\mathfrak{A}^{\text{attosec}}$. The benchmark boundary remains fixed throughout. The one operative metric is still exactly $g^\sharp$, the ordinary matter route is unchanged, there is no second operative metric, the low-energy matter law is not enlarged, and no stronger promotion language is licensed. The positive result is therefore routing discipline at the current atto-section-dynamics frontier.

1. Introduction

The active derivational program of Æther-flow Interpretation of Relativity is no longer at the current femto-section package as its default stopping point. The current active-primary theorem already showed that the current femto-section package $\mathfrak{Z}^{\text{femtosec}}$ is canonically generated by the deeper current atto-section package $\mathfrak{A}^{\text{attosec}}$. That theorem therefore spent the package-derivation option that had remained open below the current femto-section frontier.

The present note records the routing consequence of that gain. It does not reopen the already-generated current femto-section package, and it does not claim a completed first-principles substrate derivation of gravity. It records only which kind of next manuscript would now count as an honest benchmark-facing gain once the live burden has moved back to the deeper current atto-section package itself.

Framework and claim boundary. Æther / Æther-flow framework denotes the broader Æther / Æther-flow framework built on the claims that the Æther is the underlying four-dimensional substrate

of reality, the Æther-flow is its intrinsic ordered motion, observed three-dimensional space is the local experiential slice of that deeper substrate, S-time is the experienced order of change arising from matter, light, and the Æther-flow, and observed expansion is the three-dimensional appearance of deeper four-dimensional ordered motion. Within that framework, Æther-flow Interpretation of Relativity denotes the exact-closure theory in which the effective gravitational dynamics are adopted to be exactly Einsteinian with universal matter coupling. In the active sequence, *adoption* means use of that established relativistic dynamics without claiming substrate derivation, while *derivation* is reserved for a first-principles recovery from explicit substrate variables.

The present note stays strictly inside that boundary. It records only which kind of next manuscript would now count as an honest benchmark-facing gain at the current atto-section-dynamics frontier.

2. Fixed Inputs

Definition 1 (Atto-section frontier inputs)**.** *The criterion recorded here uses the following fixed inputs.*

1. *The benchmark exact-closure package, which fixes the public one-metric GR target of the repository.*
2. *The benchmark gatekeeping layer, including the recorded safeguard that blocks same-output deeper-origin relays from counting as new front-line progress once the live benchmark-relevant datum is unchanged.*
3. *The prior renewed pico-section-package frontier and the theorem deriving the current pico-section package from deeper pico-section-generating substrate femto-section dynamics, which had already moved the live burden below the current pico-section package.*
4. *The current active-primary theorem, which proves that the current femto-section package* $\mathfrak{Z}^{\mathrm{femtosec}}$ *is canonically generated by the deeper current femto-section-generating substrate atto-section dynamics package* $\mathfrak{A}^{\mathrm{attosec}}$*.*

Remark 1. *The present note does not replace those manuscripts. It records the routing consequence of reading them together under the active safeguard against recursive depth drift.*

3. Why the Current Burden Returns to the Atto-Section Package

Proposition 1 (The live burden is renewed at atto-section-package scope)**.** *At the current stage of the primitive-reservoir observer-reduction line, the current active-primary theorem renews the live benchmark-facing burden at the level of the current atto-section package* $\mathfrak{A}^{\mathrm{attosec}}$*.*

Proof. That theorem changes benchmark-facing status because it removes the current femto-section package $\mathfrak{Z}^{\mathrm{femtosec}}$ as the primitive stopping point. Once $\mathfrak{Z}^{\mathrm{femtosec}}$ is shown to be canonically induced by $\mathfrak{A}^{\mathrm{attosec}}$, the live burden no longer sits on the current femto-section package itself. It returns to the deeper package from which that package is generated. The earlier pico-section-package theorem and the preserved renewed pico-section-package routing handoff remain main-line history and routing support, but they no longer define the live frontier once the current femto-section package is itself derived from $\mathfrak{A}^{\mathrm{attosec}}$. □

Definition 2 (Benchmark-neutral deeper relay at current atto-section scope)**.** *A* benchmark-neutral deeper relay at current atto-section scope *is a manuscript that preserves the same benchmark one-metric output, the same ordinary matter route, the same current atto-section package* $\mathfrak{A}^{\text{attosec}}$*, the same current femto-section package* $\mathfrak{Z}^{\text{femtosec}}$*, the same current pico-section package* $\mathfrak{Y}^{\text{picosec}}$*, the same current minimizer-section core* $\mathfrak{Y}^{\text{pic,sec}}$*, the same current nano-section package* $\mathfrak{X}^{\text{nanosec}}$*, and the same downstream micro-section and sub-section packages while merely relocating the unexplained substrate layer deeper, repackaging the same current atto-section package, or re-expanding the presentation back to the larger minimizer-image-core or full pico-section package without a new compression, necessity, uniqueness, or comparably sharp routing gain.*

4. The Current Atto-Section Next Benchmark Criterion

Definition 3 (Admissible next benchmark-facing manuscript at current atto-section scope)**.** *At the current atto-section-dynamics frontier, a manuscript counts as an admissible next benchmark-facing move only if it does at least one of the following:*

1. *derives or justifies the current femto-section-generating substrate atto-section dynamics package* $\mathfrak{A}^{\text{attosec}}$ *from still more primitive substrate structure in a way that does more than merely relocate the unexplained layer deeper;*
2. *proves a genuinely smaller theorem-level collapse strictly inside* $\mathfrak{A}^{\text{attosec}}$*;*
3. *does either of the previous two while preserving the same benchmark one-metric package, the same ordinary matter route, and the same claim boundary.*

Theorem 1 (Next honest benchmark-facing task at current atto-section scope)**.** *The next honest benchmark-facing manuscript below the current atto-section-dynamics frontier must either derive or justify the current femto-section-generating substrate atto-section dynamics* $\mathfrak{A}^{\text{attosec}}$ *from still more primitive substrate structure in a benchmark-relevant way, or else prove a genuinely smaller theorem-level collapse strictly inside that deeper package. A manuscript that only repeats the same current atto-section package through another deeper relay, re-expands the discussion back to the larger minimizer-image-core or full pico-section presentation without such a new gain, or invokes a quantum branch without doing the same benchmark-facing work does not satisfy the criterion.*

Proof. By Proposition 1, the live burden already lies at the deeper current atto-section package $\mathfrak{A}^{\text{attosec}}$ rather than at the current femto-section package $\mathfrak{Z}^{\text{femtosec}}$ or the earlier pico-section-package handoff. Therefore a subsequent manuscript must improve on that status rather than merely accompany it. A deeper-origin manuscript can do so only if it changes benchmark-facing status by more than depth alone. If it simply reproduces the same current atto-section package and its same downstream outputs, the routing safeguard classifies it as benchmark neutral. The remaining honest alternatives are therefore exactly those stated in the definition: either a more primitive derivation or justification of the current atto-section package itself, or a sharper internal collapse strictly inside that package. □

5. What the Next Move Should Not Be

Proposition 2 (Screened next moves at the current atto-section-dynamics frontier)**.** *At the current atto-section-dynamics frontier, none of the following is the default next benchmark-facing move:*

1. *another same-output deeper-origin relay that merely preserves the current atto-section package* $\mathfrak{A}^{\mathrm{attosec}}$ *and therefore merely reproduces the same current femto-section package* $\mathfrak{Z}^{\mathrm{femtosec}}$*, the same current pico-section package* $\mathfrak{Y}^{\mathrm{picosec}}$*, the same current minimizer-section core* $\mathfrak{Y}^{\mathrm{pic,sec}}$*, the same current nano-section package* $\mathfrak{X}^{\mathrm{nanosec}}$*, and the same downstream micro-section and sub-section packages;*

2. *another re-expansion back to the larger minimizer-image-core or the full pico-section presentation as if those larger presentations were again independently live burdens;*

3. *a quantum branch that does not derive or justify the same deeper atto-section package, collapse it further, or close a benchmark derivation gate in a genuinely new way;*

4. *a manuscript that introduces a second operative metric, enlarges the ordinary matter law, or uses stronger promotion language.*

Proof. Item (1) fails the preceding criterion because it leaves the renewed live burden unchanged. Item (2) likewise fails because it re-expands to larger already-compressed presentations rather than removing remaining freedom in $\mathfrak{A}^{\mathrm{attosec}}$ or proving a smaller internal datum there. Item (3) does not directly address the live burden at current scope unless it performs the same benchmark-facing work named above. Item (4) violates the fixed claim boundary of the benchmark package and therefore cannot count as a disciplined next step on the active line. The benchmark package remains the exact one-metric GR package already fixed by adoption, so any admissible next manuscript must preserve that boundary. □

Remark 2. *This screening statement is not a denial that those deeper or alternative manuscripts may matter strategically. It is a routing statement: they are not the default way to spend the next benchmark-facing move from the current atto-section-dynamics frontier unless they do the same benchmark-facing work named above.*

6. Conclusion

The positive result of this note is routing discipline at the current atto-section-dynamics frontier. The current active-primary theorem remains the live benchmark-facing gain because it already removes the current femto-section package as the unexplained stopping point on the active line. The earlier pico-section-package theorem and renewed pico-section-package routing handoff remain preserved main-line history, but under the recursive-depth safeguard they are no longer themselves the default current frontier.

The scope remains narrow and honest. The benchmark package is unchanged: the one operative metric is still exactly $g^\sharp$, the ordinary matter route is unchanged, there is no second operative metric, and the low-energy matter law is not enlarged. Nothing here upgrades adoption to derivation or licenses stronger promotion language.

The next open burden is therefore clear. The next benchmark-facing manuscript should derive or justify the current femto-section-generating substrate atto-section dynamics from still more primitive substrate structure in a way that changes benchmark-facing status, unless the sharper honest gain available instead is a genuinely smaller theorem-level collapse strictly inside that deeper package. Another same-output deeper relay that merely preserves the current atto-section package, a re-expansion back to the larger minimizer-image-core or full pico-section presentation, or a quantum

branch that does not do that same benchmark-facing work is not the clean next manuscript target at current scope.
