The Æther-flow Interpretation of Relativity

Primitive-Reservoir Observer-Reduction
Atto-Section-Generating Substrate Zepto-Section Dynamics
Next Benchmark Criterion

Abstract

The current active-primary theorem already removed the current atto-section package $\mathfrak{A}^{\text{attosec}}$ as a primitive stopping point by deriving it canonically from the deeper current zepto-section package $\mathfrak{B}^{\text{zeptosec}}$. Another same-output deeper-origin relay that merely preserves $\mathfrak{B}^{\text{zeptosec}}$ and therefore merely reproduces the same current atto-section package $\mathfrak{A}^{\text{attosec}}$, the same current femto-section package $\mathfrak{Z}^{\text{femtosec}}$, the same current pico-section package $\mathfrak{Y}^{\text{picosec}}$, the same current minimizer-section core $\mathfrak{Y}^{\text{pic,sec}}$, the same current nano-section package $\mathfrak{X}^{\text{nanosec}}$, and the same downstream micro-section and sub-section packages no longer counts as the honest next benchmark-facing manuscript. Neither does a re-expansion back to the full zepto-section presentation, the larger minimizer-image-core or full pico-section presentation, a reopening of larger screened layers, or a quantum branch that does not do that same benchmark-facing work.

This note records the routing consequence of that theorem. The next honest benchmark-facing move must either derive or justify the current atto-section-generating substrate zepto-section dynamics package $\mathfrak{B}^{\text{zeptosec}}$ from still more primitive substrate structure in a way that changes benchmark-facing status, or prove a genuinely smaller theorem-level collapse strictly inside $\mathfrak{B}^{\text{zeptosec}}$. The benchmark boundary remains fixed throughout. The one operative metric is still exactly $g^\sharp$, the ordinary matter route is unchanged, there is no second operative metric, the low-energy matter law is not enlarged, and no stronger promotion language is licensed. The positive result is therefore routing discipline at the current zepto-section-dynamics frontier.

1. Introduction

The active derivational program of Æther-flow Interpretation of Relativity is no longer at the current atto-section package as its default stopping point. The current active-primary theorem already showed that the current atto-section package $\mathfrak{A}^{\text{attosec}}$ is canonically generated by the deeper current zepto-section package $\mathfrak{B}^{\text{zeptosec}}$. That theorem therefore spent the package-derivation option that had remained open below the current atto-section frontier.

The present note records the routing consequence of that gain. It does not reopen the already-generated current atto-section package, and it does not claim a completed first-principles substrate derivation of gravity. It records only which kind of next manuscript would now count as an honest benchmark-facing gain once the live burden has moved back to the deeper current zepto-section package itself.

Framework and claim boundary. Æther / Æther-flow framework denotes the broader Æther / Æther-flow framework built on the claims that the Æther is the underlying four-dimensional substrate

of reality, the Æther-flow is its intrinsic ordered motion, observed three-dimensional space is the local experiential slice of that deeper substrate, S-time is the experienced order of change arising from matter, light, and the Æther-flow, and observed expansion is the three-dimensional appearance of deeper four-dimensional ordered motion. Within that framework, Æther-flow Interpretation of Relativity denotes the exact-closure theory in which the effective gravitational dynamics are adopted to be exactly Einsteinian with universal matter coupling. In the active sequence, *adoption* means use of that established relativistic dynamics without claiming substrate derivation, while *derivation* is reserved for a first-principles recovery from explicit substrate variables.

The present note stays strictly inside that boundary. It records only which kind of next manuscript would now count as an honest benchmark-facing gain at the current zepto-section-dynamics frontier.

2. Fixed Inputs

Definition 1 (Zepto-section frontier inputs)**.** *The criterion recorded here uses the following fixed inputs.*

1. *The benchmark exact-closure package, which fixes the public one-metric GR target of the repository.*
2. *The benchmark gatekeeping layer, including the recorded safeguard that blocks same-output deeper-origin relays from counting as new front-line progress once the live benchmark-relevant datum is unchanged.*
3. *The prior femto-section-generating substrate atto-section dynamics frontier note, which had already recorded why the next honest move below the current atto-section frontier had to derive or justify the current atto-section package or collapse it further.*
4. *The current active-primary theorem, which proves that the current atto-section package* $\mathfrak{A}^{\text{attosec}}$ *is canonically generated by the deeper current atto-section-generating substrate zepto-section dynamics package* $\mathfrak{B}^{\text{zeptosec}}$*.*

Remark 1. *The present note does not replace those manuscripts. It records the routing consequence of reading them together under the active safeguard against recursive depth drift.*

3. Why the Current Burden Returns to the Zepto-Section Package

Proposition 1 (The live burden is renewed at zepto-section-package scope)**.** *At the current stage of the primitive-reservoir observer-reduction line, the current active-primary theorem renews the live benchmark-facing burden at the level of the current zepto-section package* $\mathfrak{B}^{\text{zeptosec}}$*.*

Proof. That theorem changes benchmark-facing status because it removes the current atto-section package $\mathfrak{A}^{\text{attosec}}$ as the primitive stopping point. Once $\mathfrak{A}^{\text{attosec}}$ is shown to be canonically induced by $\mathfrak{B}^{\text{zeptosec}}$, the live burden no longer sits on the current atto-section package itself. It returns to the deeper package from which that package is generated. The earlier atto-section frontier note remains preserved routing support, but it no longer defines the live frontier once the current atto-section package is itself derived from $\mathfrak{B}^{\text{zeptosec}}$. □

Definition 2 (Benchmark-neutral deeper relay at current zepto-section scope)**.** *A* benchmark-neutral deeper relay at current zepto-section scope *is a manuscript that preserves the same benchmark*

one-metric output, the same ordinary matter route, the same current zepto-section package $\mathfrak{B}^{\text{zeptosec}}$*, the same current atto-section package* $\mathfrak{A}^{\text{attosec}}$*, the same current femto-section package* $\mathfrak{Z}^{\text{femtosec}}$*, the same current pico-section package* $\mathfrak{Y}^{\text{picosec}}$*, the same current minimizer-section core* $\mathfrak{Y}^{\text{pic,sec}}$*, the same current nano-section package* $\mathfrak{X}^{\text{nanosec}}$*, and the same downstream micro-section and sub-section packages while merely relocating the unexplained substrate layer deeper, repackaging the same current zepto-section package, or re-expanding the presentation back to the full zepto-section package, the larger minimizer-image-core, or the full pico-section presentation without a new compression, necessity, uniqueness, or comparably sharp routing gain.*

4. The Current Zepto-Section Next Benchmark Criterion

Definition 3 (Admissible next benchmark-facing manuscript at current zepto-section scope)**.** *At the current zepto-section-dynamics frontier, a manuscript counts as an admissible next benchmark-facing move only if it does at least one of the following:*

1. *derives or justifies the current atto-section-generating substrate zepto-section dynamics package* $\mathfrak{B}^{\text{zeptosec}}$ *from still more primitive substrate structure in a way that does more than merely relocate the unexplained layer deeper;*
2. *proves a genuinely smaller theorem-level collapse strictly inside* $\mathfrak{B}^{\text{zeptosec}}$*;*
3. *does either of the previous two while preserving the same benchmark one-metric package, the same ordinary matter route, and the same claim boundary.*

Theorem 1 (Next honest benchmark-facing task at current zepto-section scope)**.** *The next honest benchmark-facing manuscript below the current zepto-section-dynamics frontier must either derive or justify the current atto-section-generating substrate zepto-section dynamics* $\mathfrak{B}^{\text{zeptosec}}$ *from still more primitive substrate structure in a benchmark-relevant way, or else prove a genuinely smaller collapse strictly inside that deeper package. A manuscript that only repeats the same current zepto-section package through another deeper relay, re-expands the discussion back to the full zepto-section presentation or the larger minimizer-image-core or full pico-section presentations without such a new gain, reopens larger screened layers, or invokes a quantum branch without doing the same benchmark-facing work does not satisfy the criterion.*

Proof. By Proposition 1, the live burden already lies at the deeper current zepto-section package $\mathfrak{B}^{\text{zeptosec}}$ rather than at the current atto-section package $\mathfrak{A}^{\text{attosec}}$. Therefore a subsequent manuscript must improve on that status rather than merely accompany it. A deeper-origin manuscript can do so only if it changes benchmark-facing status by more than depth alone. If it simply reproduces the same current zepto-section package and its same downstream outputs, the routing safeguard classifies it as benchmark neutral. The remaining honest alternatives are therefore exactly those stated in the definition: either a more primitive derivation or justification of the current zepto-section package itself, or a sharper internal collapse strictly inside that package. □

5. What the Next Move Should Not Be

Proposition 2 (Screened next moves at the current zepto-section-dynamics frontier)**.** *At the current zepto-section-dynamics frontier, none of the following is the default next benchmark-facing move:*

1. *another same-output deeper-origin relay that merely preserves the current zepto-section package* $\mathfrak{B}^{\text{zeptosec}}$ *and therefore merely reproduces the same current atto-section package* $\mathfrak{A}^{\text{attosec}}$*, the same current femto-section package* $\mathfrak{Z}^{\text{femtosec}}$*, the same current pico-section package* $\mathfrak{Y}^{\text{picosec}}$*, the same current minimizer-section core* $\mathfrak{Y}^{\text{pic,sec}}$*, the same current nano-section package* $\mathfrak{X}^{\text{nanosec}}$*, and the same downstream micro-section and sub-section packages;*

2. *another re-expansion back to the full zepto-section presentation or to the larger minimizer-image-core or full pico-section presentations as if those larger presentations were again independently live burdens;*

3. *another reopening of already-screened larger layers that does not sharpen the current zepto-section package itself;*

4. *a quantum branch that does not derive or justify the same deeper zepto-section package, collapse it further, or close a benchmark derivation gate in a genuinely new way;*

5. *a manuscript that introduces a second operative metric, enlarges the ordinary matter law, or uses stronger promotion language.*

Proof. Item (1) fails the preceding criterion because it leaves the renewed live burden unchanged. Item (2) likewise fails because it re-expands to larger already-screened presentations rather than removing remaining freedom in $\mathfrak{B}^{\text{zeptosec}}$ or proving a smaller internal datum there. Item (3) fails for the same routing reason at larger scale. Item (4) does not directly address the live burden at current scope unless it performs the same benchmark-facing work named above. Item (5) violates the fixed claim boundary of the benchmark package and therefore cannot count as a disciplined next step on the active line. The benchmark package remains the exact one-metric GR package already fixed by adoption, so any admissible next manuscript must preserve that boundary. □

Remark 2. *This screening statement is not a denial that those deeper or alternative manuscripts may matter strategically. It is a routing statement: they are not the default way to spend the next benchmark-facing move from the current zepto-section-dynamics frontier unless they do the same benchmark-facing work named above.*

6. Conclusion

The positive result of this note is routing discipline at the current zepto-section-dynamics frontier. The current active-primary theorem remains the live benchmark-facing gain because it already removes the current atto-section package as the unexplained stopping point on the active line. The earlier atto-section frontier note remains preserved main-line history and routing support, but under the recursive-depth safeguard it is no longer itself the default current frontier.

The scope remains narrow and honest. The benchmark package is unchanged: the one operative metric is still exactly $g^\sharp$, the ordinary matter route is unchanged, there is no second operative metric, and the low-energy matter law is not enlarged. Nothing here upgrades adoption to derivation or licenses stronger promotion language.

The next open burden is therefore clear. The next benchmark-facing manuscript should derive or justify the current atto-section-generating substrate zepto-section dynamics from still more primitive substrate structure in a way that changes benchmark-facing status, unless the sharper honest gain available instead is a genuinely smaller theorem-level collapse strictly inside that deeper

package. Another same-output deeper relay that merely preserves the current zepto-section package, a re-expansion back to the full zepto-section presentation or to the larger minimizer-image-core or full pico-section presentations, a reopening of larger screened layers, or a quantum branch that does not do that same benchmark-facing work is not the clean next manuscript target at current scope.
