Displacement-Body Quadratic Forcing Law
Next Benchmark Criterion

Abstract

The current active-primary theorem now proves that the canonical minimal visible-response representative $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$ is already derived canonically from a smaller benchmark-faithful section-centered displacement-body quadratic forcing law $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$ on the fixed displacement body. The visible-response operator family $S^{\mathrm{disp,resp,vis}}$ on the full displacement fibers is no longer primitive there; it is the unique operator extension of that smaller body-level law.

This note records the routing consequence of that gain. The next honest benchmark-facing move must now derive or justify the current displacement-body quadratic forcing law $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$ itself from still more primitive explicit substrate structure while preserving the same benchmark one-metric package, the same ordinary matter route, and the same claim boundary. Another manuscript that merely restates the same body-level law, merely re-extends it to the same visible-response operator family $S^{\mathrm{disp,resp,vis}}$, merely re-presents the same canonical minimal visible-response representative $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$, or restores the full canonical current-body image core $\mathfrak{S}^{\mathrm{disp,resp,cbimg}}$ or any other larger same-output package does not count as the clean next step. The one operative metric remains exactly $g^\sharp$, there is no second operative metric, the low-energy matter law is not enlarged, and no stronger promotion language is licensed.

1. Introduction

The active derivational program of Æther-flow Interpretation of Relativity is now one layer sharper again below the visible-response necessity / uniqueness frontier. The new theorem shows that even the operator-family presentation of the canonical minimal visible-response representative is no longer primitive once a smaller section-centered displacement-body quadratic forcing law is fixed. The visible-response operator is recovered canonically from that smaller law by unique extension from the actual displacement body to the full displacement fibers.

The present note records the routing consequence of that gain. It does not reopen the operator-family presentation, the full current-image-core presentation, the larger reduced-carrier presentation, the older projection/body presentation, or the full displacement-response substrate-law presentation as if any of those were again the live burden. It records only which kind of next manuscript would now count as an honest benchmark-facing gain below the new body-law frontier.

Framework and claim boundary. Æther / Æther-flow framework denotes the broader Æther / Æther-flow framework built on the claims that the Æther is the underlying four-dimensional substrate of reality, the Æther-flow is its intrinsic ordered motion, observed three-dimensional space is the local experiential slice of that deeper substrate, S-time is the experienced order of change arising from matter, light, and the Æther-flow, and observed expansion is the three-dimensional appearance of deeper four-dimensional ordered motion. Within that framework, Æther-flow Interpretation of Relativity denotes the exact-closure theory in which the effective gravitational dynamics are adopted to be exactly Einsteinian with universal matter coupling. In the active sequence, *adoption* means use of that established relativistic dynamics without claiming substrate derivation, while *derivation* is reserved for a first-principles recovery from explicit substrate variables.

The present note stays strictly inside that boundary. It records only which kind of next manuscript would now count as an honest benchmark-facing gain below the displacement-body quadratic forcing-law frontier.

2. Fixed Inputs

Definition 1 (Current forcing-law frontier inputs)**.** *The criterion recorded here uses the following fixed inputs.*

1. *The benchmark exact-closure package, which fixes the public one-metric GR target of the repository.*
2. *The benchmark gatekeeping layer, including the recorded safeguard that blocks same-output deeper-origin relays from counting as new front-line progress once the live benchmark-relevant datum is unchanged.*
3. *The preserved theorem chain showing that the older projection-operator-core package collapses benchmark-facingly to the canonical minimal visible-response representative, that even the full canonical current-body image core already collapses benchmark-facingly to that same representative, that the visible-response representative is itself necessary and unique at benchmark scope up to visible-response-faithful equivalence, and now that the same representative is derived canonically from the smaller section-centered displacement-body quadratic forcing law* $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$.
4. *The recorded fact that the current body-response core and all currently recorded downstream benchmark-facing consequences already factor through the same canonical minimal visible-response representative* $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$*, which now itself is recovered from* $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$.

Remark 1. *The present note does not replace those manuscripts. It records the routing consequence of reading them together under the active safeguard against recursive depth drift.*

3. Why the Live Burden Now Sits Below Operator Restatement

Proposition 1 (The live burden is renewed below operator restatement)**.** *At the current stage of the primitive-reservoir observer-reduction line, the displacement-body forcing-law theorem renews the live benchmark-facing burden below any mere restatement of the same section-centered displacement-body quadratic forcing law* $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$*, the same visible-response operator family* $S^{\mathrm{disp,resp,vis}}$*, or the same canonical minimal visible-response representative* $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$.

Proof. That theorem changes benchmark-facing status because it proves that the operator-family presentation is not primitive once the smaller body-level law is fixed. A later manuscript that merely rewrites the same body-level law, merely recovers the same operator family from it again, or merely restates the same canonical minimal visible-response representative removes no remaining benchmark-facing freedom. The live burden therefore no longer sits on another visible-response restatement. It sits on deriving or justifying the current body-level forcing law itself from still more primitive explicit substrate structure. □

Definition 2 (Benchmark-neutral same-body-law relay below the current frontier)**.** *A* benchmark-neutral same-body-law relay below the current frontier *is a manuscript that preserves the same benchmark one-metric output, the same ordinary matter route, the same fixed displacement body, the same section-centered displacement-body quadratic forcing law* $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$*, the same visible-response operator family* $S^{\mathrm{disp,resp,vis}}$*, the same canonical minimal visible-response representative* $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$*, and the same downstream benchmark-facing consequences while merely restating that same body-level law, merely replaying its operator extension, merely rewriting the same representative, restoring the already-spent full current-image-core package* $\mathfrak{S}^{\mathrm{disp,resp,cbimg}}$*, re-expanding to a larger reduced-carrier presentation, restoring the older projection/body presentation, replaying the full displacement-response substrate law, or otherwise carrying the same visible-response datum through another larger same-output realization.*

4. The Current Post-Forcing-Law Criterion

Definition 3 (Admissible next benchmark-facing manuscript below the current frontier)**.** *Below the current displacement-body forcing-law frontier, a manuscript counts as an admissible next benchmark-facing move only if it does at least one of the following:*

1. *derives or justifies the current body-level forcing law* $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$ *itself from still more primitive explicit substrate structure;*
2. *equivalently derives that current body-level law as a canonical readout, minimization law, selection law, or forcing consequence of a smaller explicit substrate package while preserving the same benchmark one-metric package, the same ordinary matter route, and the same claim boundary;*
3. *does one of the previous two without merely replaying the same operator extension, the same canonical minimal visible-response representative, the full current-image-core package, a larger reduced-carrier presentation, the older projection/body presentation, or the full displacement-response substrate-law presentation.*

Theorem 1 (Next honest benchmark-facing task below the current frontier)**.** *The next honest benchmark-facing manuscript below the current displacement-body forcing-law frontier must derive or justify the current section-centered displacement-body quadratic forcing law* $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$ *itself from still more primitive explicit substrate structure. A manuscript that only repeats the same body-level law, only re-extends it to the same visible-response operator family* $S^{\mathrm{disp,resp,vis}}$*, only re-presents the same canonical minimal visible-response representative* $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$*, or only restores a larger same-output package does not satisfy the criterion.*

Proof. By the preceding proposition, the live burden already lies below any mere restatement of the same body-level law or of its derived operator-family presentation. The current theorem has spent the option of treating the operator family as primitive. Therefore a subsequent manuscript must improve on the forcing law itself rather than merely accompany it through another representation. A deeper-origin manuscript can do so only if it derives or justifies that current body-level law from still more primitive explicit substrate structure. The remaining honest alternatives are therefore exactly those stated in the definition. □

5. What the Next Move Should Not Be

Proposition 2 (Screened next moves below the current frontier)**.** *Below the current displacement-body forcing-law frontier, none of the following is the default next benchmark-facing move:*

1. *another same-output relay that merely preserves the current section-centered displacement-body quadratic forcing law* $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$ *and therefore merely reproduces the same visible-response operator family* $S^{\mathrm{disp,resp,vis}}$*, the same canonical minimal visible-response representative* $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$*, the same current body-response core, and the same downstream benchmark-facing consequences;*

2. *another manuscript that merely rebuilds the operator-family presentation from the same body-level law without deriving that law itself;*

3. *another restoration of the full current-image-core package* $\mathfrak{S}^{\mathrm{disp,resp,cbimg}}$*, of a larger reduced-carrier presentation, of the older projection/body presentation, or of the full displacement-response substrate law as if those already-spent larger packages were again the honest current burden;*

4. *a manuscript that introduces a second operative metric, enlarges the ordinary matter law, or uses stronger promotion language.*

Proof. Items (1) and (2) fail the preceding criterion because they leave the renewed live burden unchanged. Item (3) fails because it returns to larger already-spent same-output packages rather than deriving the forcing law itself. Item (4) violates the fixed claim boundary of the benchmark package and therefore cannot count as a disciplined next step on the active line. □

Remark 2. *This screening statement is not a denial that those deeper or alternative manuscripts may matter strategically. It is a routing statement: they are not the default way to spend the next benchmark-facing move below the current frontier unless they do the same benchmark-facing work named above.*

6. Conclusion

The positive result of this note is routing discipline below the displacement-body forcing-law frontier. The new theorem remains the live benchmark-facing gain because it already proves that the operator-family visible-response presentation and therefore the canonical minimal visible-response representative are derived canonically once the smaller section-centered displacement-body quadratic forcing law is fixed. The earlier visible-response necessity / uniqueness theorem remains preserved handoff history because it first removed the remaining internal presentational freedom inside the

visible-response datum before the present theorem spent the operator-family presentation itself by deriving it from the smaller body-level law.

The scope remains narrow and honest. The benchmark package is unchanged: the one operative metric is still exactly $g^\sharp$, the ordinary matter route is unchanged, there is no second operative metric, and the low-energy matter law is not enlarged. Nothing here upgrades adoption to derivation or licenses stronger promotion language.

The next open burden is therefore clear. The next benchmark-facing manuscript should derive or justify the current section-centered displacement-body quadratic forcing law $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$ itself from still more primitive explicit substrate structure. Another same-body-law restatement, another same operator-extension relay, another same visible-response restatement, another restored current-image-core package, another larger reduced-carrier replay, another restored projection/body presentation, or another replay of the full displacement-response substrate law is not the clean next manuscript target at current scope.
