Next Benchmark Criterion

Abstract

The current active-primary theorem now proves that the current canonical square-root operator core $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$ is already a canonical reduced readout of a smaller hidden-response Hessian minimization law $\mathfrak{M}^{\mathrm{disp,hid,min}}$ on the fixed displacement fibers. The current carrier-bearing normalized selected-response lift $\widehat{\mathfrak{L}}^{\mathrm{disp,body,norm}}$, the current section-centered displacement-body quadratic forcing law $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$, the visible-response operator family $S^{\mathrm{disp,resp,vis}}$, and the canonical minimal visible-response representative $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$ are therefore downstream consequences of that smaller minimization-law package rather than separately primitive data.

This note records the routing consequence of that gain. The next honest benchmark-facing move must now derive or justify the current hidden-response Hessian minimization law $\mathfrak{M}^{\mathrm{disp,hid,min}}$ itself from still more primitive explicit substrate structure while preserving the same benchmark one-metric package, the same ordinary matter route, and the same claim boundary. Another manuscript that merely restates the same hidden carrier / readout / Hessian package, merely rewrites the same constrained minimization law, merely recovers the same square-root operator core $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$, merely restores the same normalized lift $\widehat{\mathfrak{L}}^{\mathrm{disp,body,norm}}$, merely restores the same body-level forcing law $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$, merely re-extends it to the same visible-response operator family $S^{\mathrm{disp,resp,vis}}$, merely re-presents the same canonical minimal visible-response representative $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$, or restores the full current-body image core $\mathfrak{S}^{\mathrm{disp,resp,cbimg}}$ or any other larger same-output package does not count as the clean next step. The one operative metric remains exactly $g^\sharp$, there is no second operative metric, the low-energy matter law is not enlarged, and no stronger promotion language is licensed.

1. Introduction

The active derivational program of Æther-flow Interpretation of Relativity has now moved one layer deeper below the carrier-bearing normalized-lift frontier and one layer deeper below the square-root-operator-core frontier itself. The new theorem shows that the current square-root operator core is no longer primitive once one keeps only the smaller hidden-response Hessian minimization law that forces it as a canonical reduced readout.

The present note records the routing consequence of that gain. It does not reopen the square-root operator core, the normalized-lift package, the selected-lift package, the body-law presentation, the visible-response operator family, the canonical minimal visible-response representative, the current-body image core, the larger reduced-carrier presentation, the older projection/body presentation, or

the full displacement-response substrate law as if any of those were again the live burden. It records only which kind of next manuscript would now count as an honest benchmark-facing gain below the hidden-response Hessian minimization-law frontier.

Framework and claim boundary. Æther / Æther-flow framework denotes the broader Æther / Æther-flow framework built on the claims that the Æther is the underlying four-dimensional substrate of reality, the Æther-flow is its intrinsic ordered motion, observed three-dimensional space is the local experiential slice of that deeper substrate, S-time is the experienced order of change arising from matter, light, and the Æther-flow, and observed expansion is the three-dimensional appearance of deeper four-dimensional ordered motion. Within that framework, Æther-flow Interpretation of Relativity denotes the exact-closure theory in which the effective gravitational dynamics are adopted to be exactly Einsteinian with universal matter coupling. In the active sequence, *adoption* means use of that established relativistic dynamics without claiming substrate derivation, while *derivation* is reserved for a first-principles recovery from explicit substrate variables.

The present note stays strictly inside that boundary. It records only which kind of next manuscript would now count as an honest benchmark-facing gain below the hidden-response Hessian minimization-law frontier.

2. Fixed Inputs

Definition 1 (Current hidden-response-Hessian-minimization frontier inputs)**.** *The criterion recorded here uses the following fixed inputs.*

1. *The benchmark exact-closure package, which fixes the public one-metric GR target of the repository.*

2. *The benchmark gatekeeping layer, including the recorded safeguard that blocks same-output deeper-origin relays from counting as new front-line progress once the live benchmark-relevant datum is unchanged.*

3. *The preserved theorem chain showing that the visible-response datum already follows from the smaller body-level forcing law, that even that body-level forcing law already follows from the smaller selected-lift package, that even the operator-bearing selected-lift package already collapses benchmark-facingly to the smaller canonical normalized selected-response lift* $\widehat{\mathfrak{L}}^{\mathrm{disp,body,norm}}$*, that even that carrier-bearing normalized lift already collapses benchmark-facingly to the smaller canonical square-root operator core* $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$*, and now that even that square-root operator core already follows canonically from the smaller hidden-response Hessian minimization law* $\mathfrak{M}^{\mathrm{disp,hid,min}}$*.*

4. *The recorded fact that the current body-response core and all currently recorded downstream benchmark-facing consequences already factor through the same square-root operator core* $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$*, and therefore now through the same hidden-response Hessian minimization law* $\mathfrak{M}^{\mathrm{disp,hid,min}}$*.*

Remark 1. *The present note does not replace those manuscripts. It records the routing consequence of reading them together under the active safeguard against recursive depth drift.*

3. Why the Live Burden Now Sits Below Minimization-Law Restatement

Proposition 1 (The live burden is renewed below hidden-response minimization-law restatement)**.** *At the current stage of the primitive-reservoir observer-reduction line, the hidden-response-Hessian-minimization theorem renews the live benchmark-facing burden below any mere restatement of the same hidden-response carrier / readout / Hessian package* $\mathfrak{M}^{\mathrm{disp,hid,min}}$*, the same square-root operator core* $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$*, the same carrier-bearing normalized lift* $\widehat{\mathfrak{L}}^{\mathrm{disp,body,norm}}$*, the same body-level forcing law* $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$*, the same visible-response operator family* $S^{\mathrm{disp,resp,vis}}$*, or the same canonical minimal visible-response representative* $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$*.*

Proof. That theorem changes benchmark-facing status because it proves that the current square-root operator core is not primitive once the deeper hidden-response Hessian minimization law is fixed. A later manuscript that merely rewrites the same hidden carrier / readout / Hessian package, merely rewrites the same minimization law, merely restores the same square-root operator core, merely restores the same normalized lift, merely restores the same body-level law, merely recovers the same operator family from it again, or merely restates the same canonical minimal visible-response representative removes no remaining benchmark-facing freedom. The live burden therefore no longer sits on another hidden-response-minimization-law replay. It sits on deriving or justifying that minimization law itself from still more primitive explicit substrate structure. □

Definition 2 (Benchmark-neutral same-hidden-minimization-law relay below the current frontier)**.** *A* benchmark-neutral same-hidden-minimization-law relay below the current frontier *is a manuscript that preserves the same benchmark one-metric output, the same ordinary matter route, the same hidden-response minimization law* $\mathfrak{M}^{\mathrm{disp,hid,min}}$ *with the same readout family* $\Pi^{\mathrm{disp,hid}}$ *and the same positive hidden Hessian family* $A^{\mathrm{disp,hid}}$*, the same canonical square-root operator core* $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$*, the same canonical normalized selected-response lift* $\widehat{\mathfrak{L}}^{\mathrm{disp,body,norm}}$*, the same section-centered displacement-body quadratic forcing law* $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$*, the same visible-response operator family* $S^{\mathrm{disp,resp,vis}}$*, the same canonical minimal visible-response representative* $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$*, and the same downstream benchmark-facing consequences while merely restating that same minimization law, merely replaying the same square-root operator core, merely restoring the same normalized lift, merely replaying the same body-level law, merely replaying its operator extension, merely rewriting the same representative, restoring the already-spent full current-body image core package* $\mathfrak{S}^{\mathrm{disp,resp,cbimg}}$*, re-expanding to a larger reduced-carrier presentation, restoring the older projection/body presentation, replaying the full displacement-response substrate law, or otherwise carrying the same visible-response datum through another larger same-output realization.*

4. The Current Post-Minimization-Law Criterion

Definition 3 (Admissible next benchmark-facing manuscript below the current frontier)**.** *Below the current hidden-response Hessian minimization-law frontier, a manuscript counts as an admissible next benchmark-facing move only if it does at least one of the following:*

1. *derives or justifies the current hidden-response Hessian minimization law* $\mathfrak{M}^{\mathrm{disp,hid,min}}$ *itself from still more primitive explicit substrate structure;*

2. *equivalently derives that current minimization law as a canonical readout, minimization law, selection law, operator factor, or forcing consequence of a still smaller explicit substrate package*

while preserving the same benchmark one-metric package, the same ordinary matter route, and the same claim boundary;

3. *does one of the previous two without merely replaying the same hidden-response carrier / readout / Hessian package, the same square-root operator core* $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$*, the same normalized lift* $\widehat{\mathfrak{L}}^{\mathrm{disp,body,norm}}$*, the same body-level forcing law* $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$*, the same visible-response operator family* $S^{\mathrm{disp,resp,vis}}$*, or the same canonical minimal visible-response representative* $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$*, and without restoring the full current-body image-core package* $\mathfrak{S}^{\mathrm{disp,resp,cbimg}}$*, a larger reduced-carrier presentation, the older projection/body presentation, or the full displacement-response substrate-law presentation.*

Theorem 1 (Next honest benchmark-facing task below the current frontier)**.** *The next honest benchmark-facing manuscript below the current hidden-response Hessian minimization-law frontier must derive or justify the current hidden-response Hessian minimization law* $\mathfrak{M}^{\mathrm{disp,hid,min}}$ *itself from still more primitive explicit substrate structure. A manuscript that only repeats the same hidden carrier / readout / Hessian package, only repeats the same minimization law, only restores the same square-root operator core* $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$*, only restores the same normalized lift* $\widehat{\mathfrak{L}}^{\mathrm{disp,body,norm}}$*, only re-reads off the same body-level law* $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$*, only re-extends it to the same visible-response operator family* $S^{\mathrm{disp,resp,vis}}$*, only re-presents the same canonical minimal visible-response representative* $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$*, or only restores a larger same-output package does not satisfy the criterion.*

Proof. By the preceding proposition, the live burden already lies below any mere restatement of the same hidden-response minimization law or of the same square-root-core and normalized-lift and body-law and operator-level presentations that follow from it. The current theorem has spent the option of treating the square-root operator core as primitive. Therefore a subsequent manuscript must improve on the hidden-response Hessian minimization law itself rather than merely accompany it through another representation. A deeper-origin manuscript can do so only if it derives or justifies that current minimization law from still more primitive explicit substrate structure. The remaining honest alternatives are therefore exactly those stated in the definition. □

5. What the Next Move Should Not Be

Proposition 2 (Screened next moves below the current frontier)**.** *Below the current hidden-response Hessian minimization-law frontier, none of the following is the default next benchmark-facing move:*

1. *another same-output relay that merely preserves the current hidden-response minimization law* $\mathfrak{M}^{\mathrm{disp,hid,min}}$ *and therefore merely reproduces the same square-root operator core* $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$*, the same canonical normalized lift* $\widehat{\mathfrak{L}}^{\mathrm{disp,body,norm}}$*, the same section-centered displacement-body quadratic forcing law* $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$*, the same visible-response operator family* $S^{\mathrm{disp,resp,vis}}$*, the same canonical minimal visible-response representative* $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$*, the same current body-response core, and the same downstream benchmark-facing consequences;*

2. *another manuscript that merely restores the square-root operator core or the normalized lift from the same minimization law without deriving that minimization law itself;*

3. *another restoration of the full current-body image-core package* $\mathfrak{S}^{\mathrm{disp,resp,cbimg}}$*, of a larger reduced-carrier presentation, of the older projection/body presentation, or of the full displacement-*

response substrate law as if those already-spent larger packages were again the honest current burden;

4. *a manuscript that introduces a second operative metric, enlarges the ordinary matter law, or uses stronger promotion language.*

Proof. Items (1) and (2) fail the preceding criterion because they leave the renewed live burden unchanged. Item (3) fails because it returns to larger already-spent same-output packages rather than deriving the hidden-response Hessian minimization law itself. Item (4) violates the fixed claim boundary of the benchmark package and therefore cannot count as a disciplined next step on the active line. □

Remark 2. *This screening statement is not a denial that those deeper or alternative manuscripts may matter strategically. It is a routing statement: they are not the default way to spend the next benchmark-facing move below the current frontier unless they do the same benchmark-facing work named above.*

6. Conclusion

The positive result of this note is routing discipline below the hidden-response Hessian minimization-law frontier. The new theorem remains the live benchmark-facing gain because it already proves that the current square-root operator core is a canonical consequence of the smaller hidden-response Hessian minimization law, and the earlier square-root-core collapse theorem remains preserved handoff history because it first removed the carrier-bearing normalized-lift presentation as the primitive stopping point before the present theorem spent the square-root operator core itself.

The scope remains narrow and honest. The benchmark package is unchanged: the one operative metric is still exactly $g^\sharp$, the ordinary matter route is unchanged, there is no second operative metric, and the low-energy matter law is not enlarged. Nothing here upgrades adoption to derivation or licenses stronger promotion language.

The next open burden is therefore clear. The next benchmark-facing manuscript should derive or justify the current hidden-response Hessian minimization law $\mathfrak{M}^{\mathrm{disp,hid,min}}$ itself from still more primitive explicit substrate structure. Another same-hidden-minimization-law relay, another same square-root-core restatement, another same normalized-lift restatement, another same body-law restatement, another same operator-extension relay, another same visible-response restatement, another restored current-body-image-core package, another larger reduced-carrier replay, another restored projection/body presentation, or another replay of the full displacement-response substrate law is not the clean next manuscript target at current scope.
