Section-Centered Hidden-Response
Canonical Normalized Selected-Response
Lift Collapse to a Canonical
Square-Root Operator Core
Next Benchmark Criterion

Abstract

The current active-primary theorem now proves that the carrier-bearing canonical normalized selected-response lift $\widehat{\mathfrak{L}}^{\mathrm{disp,body,norm}}$ already collapses benchmark-facingly to a smaller canonical square-root operator core $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$ on the fixed displacement fibers. The current section-centered displacement-body quadratic forcing law $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$, the visible-response operator family $S^{\mathrm{disp,resp,vis}}$, and the canonical minimal visible-response representative $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$ are therefore downstream consequences of that smaller square-root operator core rather than separately primitive data.

This note records the routing consequence of that gain. The next honest benchmark-facing move must now derive or justify the current canonical square-root operator core $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$ itself from still more primitive explicit substrate structure while preserving the same benchmark one-metric package, the same ordinary matter route, and the same claim boundary. Another manuscript that merely restates the same square-root operator core, merely restores the larger carrier-bearing normalized selected-response lift $\widehat{\mathfrak{L}}^{\mathrm{disp,body,norm}}$, merely restores the operator-bearing body-lift response selection, merely reproduces the same body-level forcing law $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$, merely re-extends it to the same visible-response operator family $S^{\mathrm{disp,resp,vis}}$, merely re-presents the same canonical minimal visible-response representative $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$, or restores the full canonical current-body image core $\mathfrak{S}^{\mathrm{disp,resp,cbimg}}$ or any other larger same-output package does not count as the clean next step. The one operative metric remains exactly $g^{\sharp}$, there is no second operative metric, the low-energy matter law is not enlarged, and no stronger promotion language is licensed.

1. Introduction

The active derivational program of Æther-flow Interpretation of Relativity is now one layer sharper again below the carrier-bearing normalized selected-response-lift frontier. The new theorem shows that even the current normalized-lift package is no longer primitive once one keeps only the smaller canonical square-root operator core on the fixed displacement fibers. The benchmark-facing datum has therefore moved below the carrier-bearing lift presentation itself.

The present note records the routing consequence of that gain. It does not reopen the normalized-lift package, the selected-lift package, the body-law presentation, the operator-family presentation, the canonical minimal visible-response representative, the full canonical current-body image core, the

larger reduced-carrier presentation, the older projection/body presentation, or the full displacement-response substrate-law presentation as if any of those were again the live burden. It records only which kind of next manuscript would now count as an honest benchmark-facing gain below the new square-root-operator-core frontier.

Framework and claim boundary. Æther / Æther-flow framework denotes the broader Æther / Æther-flow framework built on the claims that the Æther is the underlying four-dimensional substrate of reality, the Æther-flow is its intrinsic ordered motion, observed three-dimensional space is the local experiential slice of that deeper substrate, S-time is the experienced order of change arising from matter, light, and the Æther-flow, and observed expansion is the three-dimensional appearance of deeper four-dimensional ordered motion. Within that framework, Æther-flow Interpretation of Relativity denotes the exact-closure theory in which the effective gravitational dynamics are adopted to be exactly Einsteinian with universal matter coupling. In the active sequence, *adoption* means use of that established relativistic dynamics without claiming substrate derivation, while *derivation* is reserved for a first-principles recovery from explicit substrate variables.

The present note stays strictly inside that boundary. It records only which kind of next manuscript would now count as an honest benchmark-facing gain below the square-root-operator-core frontier.

2. Fixed Inputs

Definition 1 (Current square-root-operator-core frontier inputs)**.** *The criterion recorded here uses the following fixed inputs.*

1. *The benchmark exact-closure package, which fixes the public one-metric GR target of the repository.*
2. *The benchmark gatekeeping layer, including the recorded safeguard that blocks same-output deeper-origin relays from counting as new front-line progress once the live benchmark-relevant datum is unchanged.*
3. *The preserved theorem chain showing that the visible-response datum already follows from the smaller body-level forcing law, that even that current body-level forcing law already follows from the smaller selected-lift package, that even the operator-bearing selected-lift package already collapses benchmark-facingly to the smaller canonical normalized selected-response lift* $\widehat{\mathfrak{L}}^{\mathrm{disp,body,norm}}$*, and now that even that carrier-bearing normalized lift already collapses benchmark-facingly to the smaller canonical square-root operator core* $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$*.*
4. *The recorded fact that the current body-response core and all currently recorded downstream benchmark-facing consequences already factor through the same forcing law* $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$*, and therefore now through the same square-root operator core* $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$*.*

Remark 1. *The present note does not replace those manuscripts. It records the routing consequence of reading them together under the active safeguard against recursive depth drift.*

3. Why the Live Burden Now Sits Below Normalized-Lift Restatement

Proposition 1 (The live burden is renewed below normalized-lift restatement)**.** *At the current stage of the primitive-reservoir observer-reduction line, the square-root-operator-core collapse theorem*

renews the live benchmark-facing burden below any mere restatement of the same canonical square-root operator core $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$*, the same carrier-bearing canonical normalized selected-response lift* $\widehat{\mathfrak{L}}^{\mathrm{disp,body,norm}}$*, the same operator-bearing body-lift response selection, the same section-centered displacement-body quadratic forcing law* $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$*, the same visible-response operator family* $S^{\mathrm{disp,resp,vis}}$*, or the same canonical minimal visible-response representative* $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$*.*

Proof. That theorem changes benchmark-facing status because it proves that the separate carrier-bearing normalized-lift presentation is not primitive once the smaller square-root operator core is fixed. A later manuscript that merely rewrites the same square-root operator core, merely restores the same carrier-bearing normalized lift, merely restores the same operator-bearing selected-lift package, merely rewrites the same body-level law, merely recovers the same operator family from it again, or merely restates the same canonical minimal visible-response representative removes no remaining benchmark-facing freedom. The live burden therefore no longer sits on another normalized-lift replay. It sits on deriving or justifying the square-root operator core itself from still more primitive explicit substrate structure. □

Definition 2 (Benchmark-neutral same-square-root-core relay below the current frontier)**.** *A* benchmark-neutral same-square-root-core relay below the current frontier *is a manuscript that preserves the same benchmark one-metric output, the same ordinary matter route, the same fixed displacement body, the same canonical square-root operator core* $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$*, the same canonical normalized selected-response lift* $\widehat{\mathfrak{L}}^{\mathrm{disp,body,norm}}$*, the same operator-bearing body-lift response selection, the same section-centered displacement-body quadratic forcing law* $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$*, the same visible-response operator family* $S^{\mathrm{disp,resp,vis}}$*, the same canonical minimal visible-response representative* $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$*, and the same downstream benchmark-facing consequences while merely restating that same square-root operator core, merely restoring the same carrier-bearing normalized lift, merely restoring the same operator-bearing selected-lift package, merely replaying the same body-level law, merely replaying its operator extension, merely rewriting the same representative, restoring the already-spent full current-image-core package* $\mathfrak{S}^{\mathrm{disp,resp,cbimg}}$*, re-expanding to a larger reduced-carrier presentation, restoring the older projection/body presentation, replaying the full displacement-response substrate law, or otherwise carrying the same visible-response datum through another larger same-output realization.*

4. The Current Post-Square-Root-Operator-Core Criterion

Definition 3 (Admissible next benchmark-facing manuscript below the current frontier)**.** *Below the current square-root-operator-core frontier, a manuscript counts as an admissible next benchmark-facing move only if it does at least one of the following:*

1. *derives or justifies the current canonical square-root operator core* $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$ *itself from still more primitive explicit substrate structure;*

2. *equivalently derives that current square-root operator core as a canonical readout, minimization law, selection law, operator factor, or forcing consequence of a still smaller explicit substrate package while preserving the same benchmark one-metric package, the same ordinary matter route, and the same claim boundary;*

3. *does one of the previous two without merely replaying the same carrier-bearing normalized selected-response lift* $\widehat{\mathfrak{L}}^{\mathrm{disp,body,norm}}$*, the same operator-bearing selected-lift package, the same*

body-level forcing law $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$, the same visible-response operator family $S^{\mathrm{disp,resp,vis}}$, or the same canonical minimal visible-response representative $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$, and without restoring the full current-image-core package $\mathfrak{S}^{\mathrm{disp,resp,cbimg}}$, a larger reduced-carrier presentation, the older projection/body presentation, or the full displacement-response substrate-law presentation.

Theorem 1 (Next honest benchmark-facing task below the current frontier)**.** *The next honest benchmark-facing manuscript below the current square-root-operator-core frontier must derive or justify the current canonical square-root operator core $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$ itself from still more primitive explicit substrate structure. A manuscript that only repeats the same square-root operator core, only restores the same carrier-bearing normalized selected-response lift $\widehat{\mathfrak{L}}^{\mathrm{disp,body,norm}}$, only restores the same operator-bearing selected-lift package, only re-reads off the same body-level law $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$, only re-extends it to the same visible-response operator family $S^{\mathrm{disp,resp,vis}}$, only re-presents the same canonical minimal visible-response representative $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$, or only restores a larger same-output package does not satisfy the criterion.*

Proof. By the preceding proposition, the live burden already lies below any mere restatement of the same square-root operator core or of the same normalized-lift and selected-lift and body-law and operator-level presentations that follow from it. The current theorem has spent the option of treating the carrier-bearing normalized-lift package as primitive. Therefore a subsequent manuscript must improve on the square-root operator core itself rather than merely accompany it through another representation. A deeper-origin manuscript can do so only if it derives or justifies that current square-root operator core from still more primitive explicit substrate structure. The remaining honest alternatives are therefore exactly those stated in the definition. □

5. What the Next Move Should Not Be

Proposition 2 (Screened next moves below the current frontier)**.** *Below the current square-root-operator-core frontier, none of the following is the default next benchmark-facing move:*

1. *another same-output relay that merely preserves the current canonical square-root operator core $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$ and therefore merely reproduces the same carrier-bearing canonical normalized selected-response lift $\widehat{\mathfrak{L}}^{\mathrm{disp,body,norm}}$, the same operator-bearing body-lift response selection, the same section-centered displacement-body quadratic forcing law $\mathscr{F}^{\mathrm{disp,resp,vis,body}}$, the same visible-response operator family $S^{\mathrm{disp,resp,vis}}$, the same canonical minimal visible-response representative $\mathfrak{S}^{\mathrm{disp,resp,red,min}}$, the same current body-response core, and the same downstream benchmark-facing consequences;*

2. *another manuscript that merely restores the carrier-bearing normalized selected-response lift from the same square-root operator core without deriving that square-root operator core itself;*

3. *another restoration of the full current-image-core package $\mathfrak{S}^{\mathrm{disp,resp,cbimg}}$, of a larger reduced-carrier presentation, of the older projection/body presentation, or of the full displacement-response substrate law as if those already-spent larger packages were again the honest current burden;*

4. *a manuscript that introduces a second operative metric, enlarges the ordinary matter law, or uses stronger promotion language.*

Proof. Items (1) and (2) fail the preceding criterion because they leave the renewed live burden unchanged. Item (3) fails because it returns to larger already-spent same-output packages rather than deriving the square-root operator core itself. Item (4) violates the fixed claim boundary of the benchmark package and therefore cannot count as a disciplined next step on the active line. □

Remark 2. *This screening statement is not a denial that those deeper or alternative manuscripts may matter strategically. It is a routing statement: they are not the default way to spend the next benchmark-facing move below the current frontier unless they do the same benchmark-facing work named above.*

6. Conclusion

The positive result of this note is routing discipline below the square-root-operator-core frontier. The new theorem remains the live benchmark-facing gain because it already proves that the current carrier-bearing normalized selected-response lift is a canonical consequence of the smaller square-root operator core, and the earlier normalized-lift collapse theorem remains preserved handoff history because it first removed the operator-bearing selected-lift presentation as the primitive stopping point before the present theorem spent the carrier-bearing normalized lift itself.

The scope remains narrow and honest. The benchmark package is unchanged: the one operative metric is still exactly $g^\sharp$, the ordinary matter route is unchanged, there is no second operative metric, and the low-energy matter law is not enlarged. Nothing here upgrades adoption to derivation or licenses stronger promotion language.

The next open burden is therefore clear. The next benchmark-facing manuscript should derive or justify the current canonical square-root operator core $\mathfrak{O}^{\mathrm{disp,body,sqrt}}$ itself from still more primitive explicit substrate structure. Another same-square-root-core relay, another same normalized-lift restatement, another same selected-lift restatement, another same body-law restatement, another same operator-extension relay, another same visible-response restatement, another restored current-image-core package, another larger reduced-carrier replay, another restored projection/body presentation, or another replay of the full displacement-response substrate law is not the clean next manuscript target at current scope.
